

The Green Scene

DOOR SOLUTIONS, LLC

Selling Energy Safe and Environmental Friendly Doors!

There was a time when the word “eco-friendly” was synonymous with hippies and tree-huggers. Today, green is going mainstream. From hybrid cars to organic food, everyone wants to be green, including the building industry. Builders, architects and even homeowners are seeking products that are good for the environment.

Today’s green movement began more than 30 years ago as a grassroots organization with a shared goal of protecting and preserving the natural environment. In the ‘80s, more concerns were brought to light, including acid rain, the safe disposal of nuclear waste and a hole in the earth’s ozone layer. It wasn’t until the 1990s that words like “eco-friendly” and “green” become buzz words.

What is Green?

What’s considered green - and what isn’t - has long been a point of confusion for consumers and many in the building industry. There are many different facets of green - products that use recycled materials, energy conservation, and methods of manufacturing, packing and shipping.

In the door industry, there are already a handful of products considered “green”. Residential doors made with recycled products or reclaimed wood are readily available – and sought after by homeowners, architects and builders alike. Door Solutions is proud to install these “green” doors that truly look astonishing. With garage doors accounting for up to 40 percent of the front of a home, there is significant potential for energy inefficiency through heat loss. Door solutions offers customers’ insulated doors that can help you save money on your cooling and heating bills. Heat loss and its flow through a home is measured by “thermal resistance,” known in the door industry as R-value. Essentially, the higher the R-value, the more effective the insulation.
